

PRODUCT INFORMATION

RFI “PROTECTION” vs. “IMMUNITY”

All standard Heise® PTE handheld calibrators are provided with RFI “protection.” This means that the unit’s displayed readings may show some fluctuation when subjected to RFI but is “protected” against damage and loss of accuracy under such conditions and will return to normal reading when the RFI field is removed.

RFI “immunity” means that the calibrator has full RFI “protection” and the display will *not* fluctuate when subjected to RFI fields. This “immunity” is available by ordering the base unit and pressure modules with CE mark approval.

Note: CE approval is not available on the FM option.
